

📁 File Organizer

A Python automation script that moves all `.jpg` / `.jpeg` images from a folder into an `Images/` sub-folder automatically.

Features

- Scans the target directory for `.jpg` and `.jpeg` files (case-insensitive)
- Creates an `Images/` sub-folder automatically if it doesn't exist
- Handles filename conflicts by appending a timestamp — no files are ever overwritten
- Writes a timestamped `organizer\_log.txt` after every run
- Works on any folder via command-line argument

How to Run

```
```bash
Organize the current directory
python file_organizer.py

Organize a specific folder
python file_organizer.py /path/to/your/folder
```
```

Example Output

```
...

=====

  📁  FILE ORGANIZER  📁

=====

Scanning: /home/user/Downloads

📁 Destination folder: /home/user/Downloads/Images

✅ Moved: photo1.jpg → Images/photo1.jpg
✅ Moved: vacation.jpeg → Images/vacation.jpeg

📊 Summary: 2 file(s) moved, 0 skipped.
📝 Log saved to: organizer_log.txt
...
```
